

## **Introduction and Problem statement**

In this project, we will study, analyze, cluster and compare neighborhoods of two Important locations of India: Delhi and Pune. This will act as a guide for people who leave their native place and come to a new city to pursue their careers.

This is applicable for any city, here we consider that a newly Graduated Engineer has left his native place in Delhi and has come to Pune to pursue his career.

We will primarily investigate how similar is the area (specific Postal Code, here we will use 110095 from Delhi) that he has left to the area (Postal Code in Pune 411057) where he is now living. Doing this project will also enable us to understand similarities and dissimilarities between two Locations as we will compare neighborhoods of Delhi and Pune.

**Target Audience:** People who come to a completely unknown city to pursue their careers. I believe the people I am targeting will appreciate such a solution as this will help them to adjust to the new environment and will make them feel like home.
